

GSG FOR CLIMATE POWER, APRIL 2026

Data Center Survey Analysis

CONFIDENTIAL. FOR RECIPIENT'S USE ONLY. UNAUTHORIZED USE, DISTRIBUTION OR COPYING IS PROHIBITED.

Methodology

Voters

Global Strategy Group conducted a survey of **2070 registered voters nationwide** between April 9 and April 19, 2026, including a base sample of 1003 voters and oversamples to reach the following sample sizes:

- 380 Black, 286 Hispanic, and 145 AAPI voters
- 338 self-identified independent voters
- 447 urban voters in states with Democratic governors
- 327 urban voters in states with Republican governors
- 272 rural voters in counties with contested data center activity
 - *Contested data center activity: canceled data centers, observed opposition, stopped by local government, or restrictive ordinances, defined by Heatmap county list.*
- 472 suburban/urban voters in counties with contested data centers
- 949 voters in counties with upcoming data centers
- 1,351 voters in counties with existing data centers

Margin of error

The margin of error at the 95% confidence level is +/- 3.1% for the base sample.

The margin of error on sub-samples is greater.

- Black voters: MoE +/- 5.0%
- Hispanic voters: MoE +/- 5.8%
- AAPI voters: MoE +/- 8.1%
- Independent voters: MoE +/- 5.3%
- Urban Dem governor state voters: MoE +/- 4.6%
- Urban GOP governor state voters: MoE +/- 5.4%
- Rural contested DC county voters: MoE +/- 5.9%
- Suburban/urban contested DC county voters: MoE +/- 4.5%
- Upcoming data center county voters: MoE +/- 3.2%
- Existing data center county voters: MoE +/- 2.7%

This survey used data from Heatmap to examine segments of voters who live near current or upcoming data center sites, as well as contested data center sites, differentiating between urban/suburban and rural voters to give a more nuanced picture of opinions on the issue.

Key Findings

1

Views on AI and data centers are still dynamic and undefined.

One in five voters haven't heard anything about data centers and don't know where the nearest one is to their community. Voters are unsure whether solutions should come from federal, state, or local leaders.

2

Varying experiences with local data centers play a major role in shaping how voters interact with the topic.

Voters in rural counties where there have been contentious public debates around data centers are far more staunchly opposed to having one in their community than voters overall. Those in suburban and urban communities with contentious public debates around data centers; those in counties with upcoming data centers; and those in counties with existing data centers more closely resemble the general population.

3

What voters DO know is that their costs are rising, and they want action.

They trust state and local leaders more than the federal government on data centers and utilities than on other issues.

With much uncertainty in the landscape, voters are data center NIMBYs, but powering data centers with clean energy overcomes these concerns.

Powering data centers with clean energy creates an odd bedfellows effect, where typical Democratic strongholds – liberals, college-educated women, and people of color – are pulled in by the prospect of clean energy, in partnership with those who always support data centers no matter the power source: men, especially younger men.

- Voters in rural counties with contentious data centers remain less supportive of local data centers than voters overall, even when powered by clean energy (though a majority of them do support clean energy-powered data centers). Suburban/urban voters with contentious data centers, those with upcoming data centers, and those with existing data centers look more like the general population.

5

The strongest messaging in favor of clean energy-powered data centers focuses on bringing down costs, increasing electricity reliability, and building in a way that is responsible with wind and solar.

Voters are skeptical of the tech companies behind data centers and have real concerns that data centers will drive up local utility costs. Messaging that assuages these concerns is key to getting voters to support clean energy-powered data centers in their communities.

Landscape

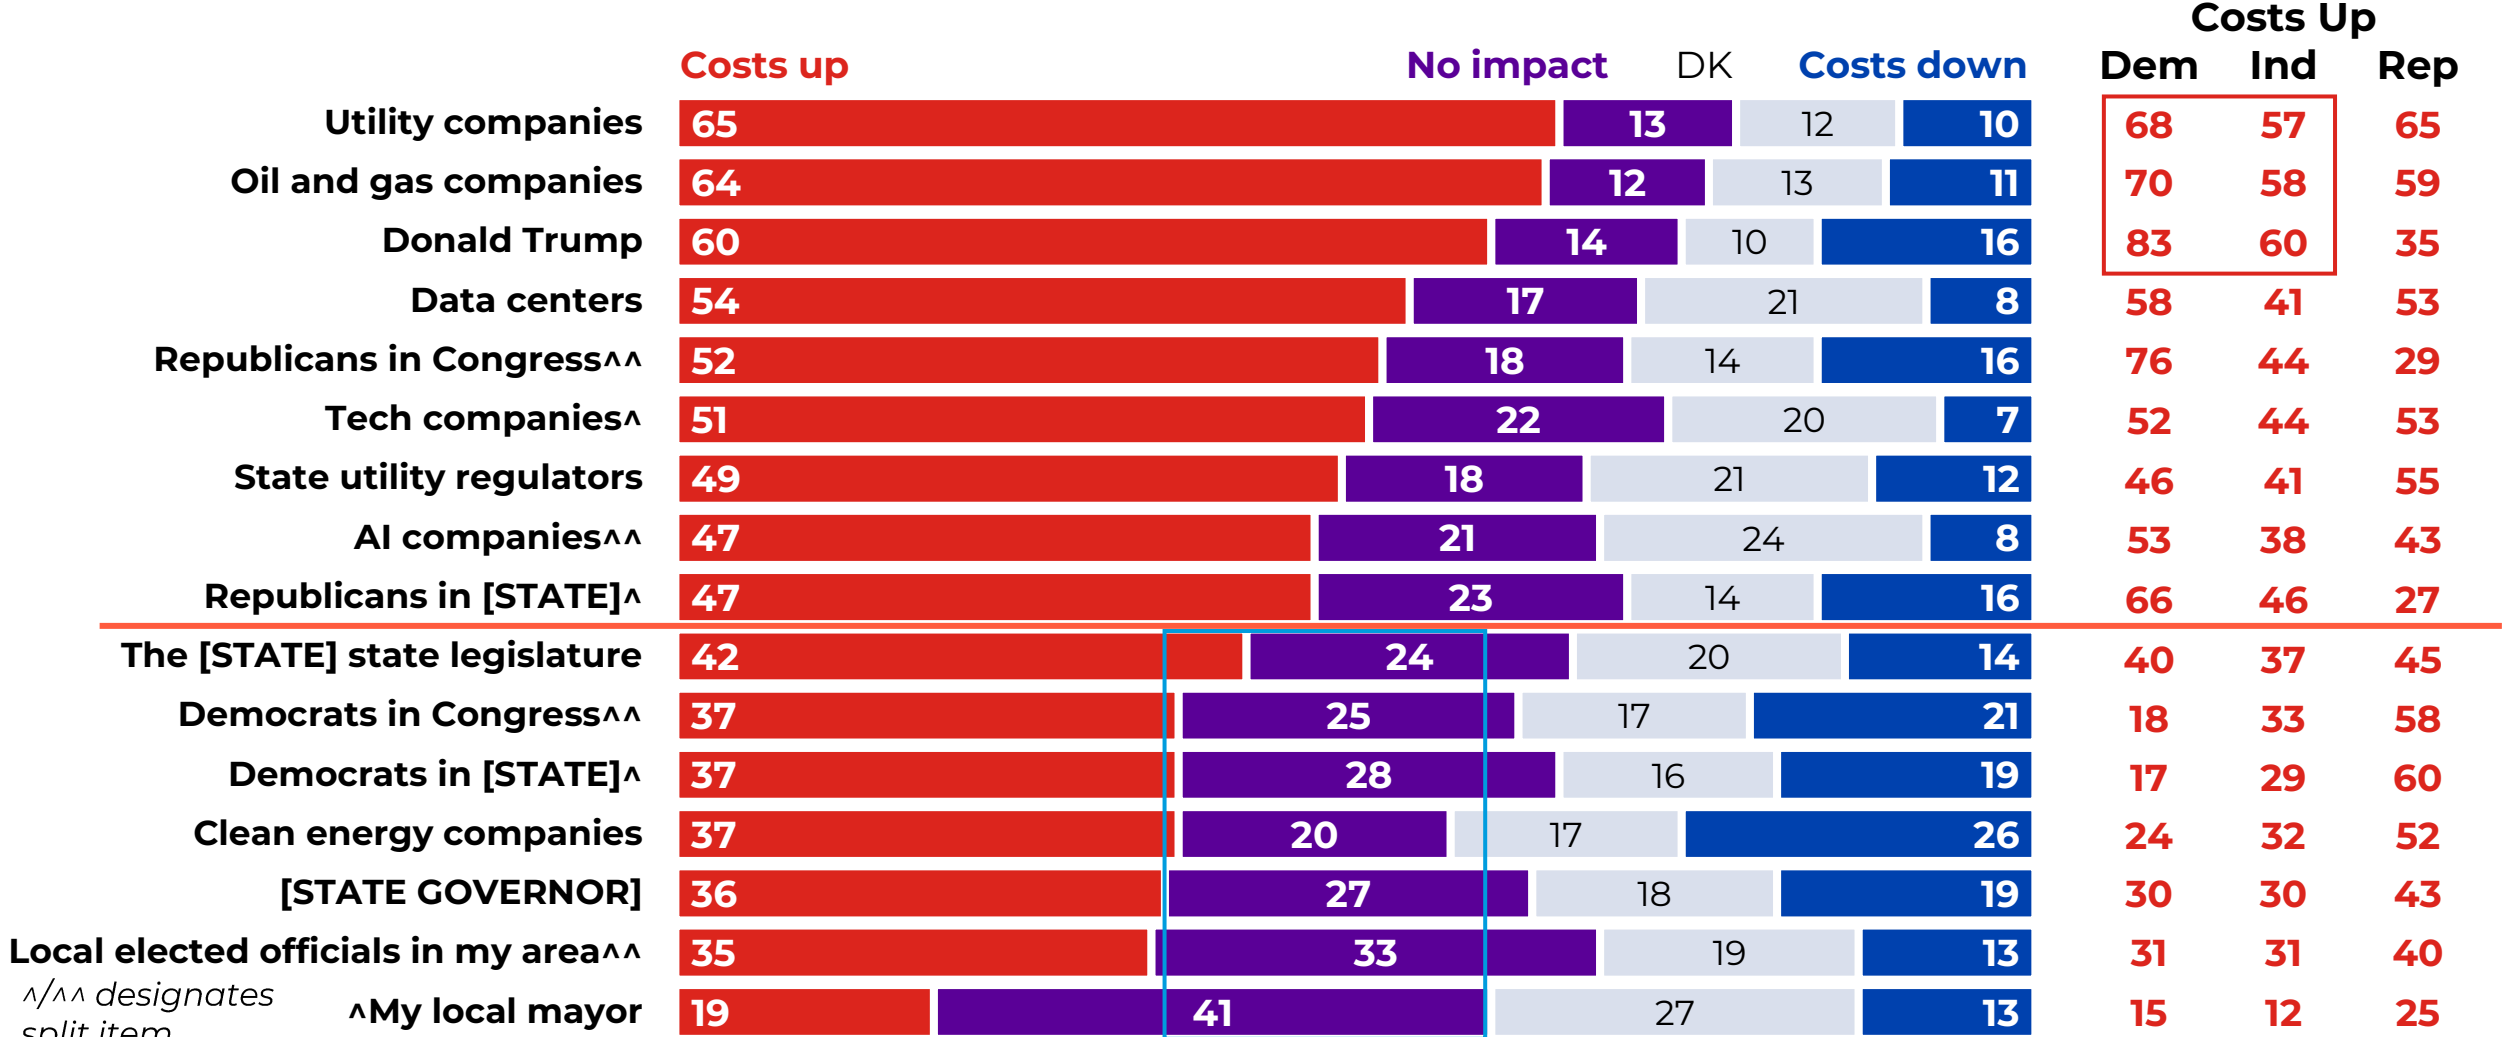

Amid the ongoing war with Iran, gas prices are seen as increasing most, but overwhelming bipartisan majorities say gas, utilities, groceries on the rise

Please indicate, for each one, whether you feel like those costs are going up, going down, or staying the same.

Utilities, oil/gas, Trump/GOP in Congress, DCs/AI/tech companies are all seen as causing costs to rise, while majorities do not believe local/state electeds are driving up costs

Indicate for each one whether you think they are helping to bring utility costs down, are causing utility costs to go up, or are not having any impact on utility costs.

^^ designates split item

Neither party has a real advantage right now on issues related to costs and data centers, with many defaulting to “neither” – especially independents

Party Trust

While more look to the federal government on several cost issues, many have no idea where to look. More look to state and local government on data centers and utilities than on other issues

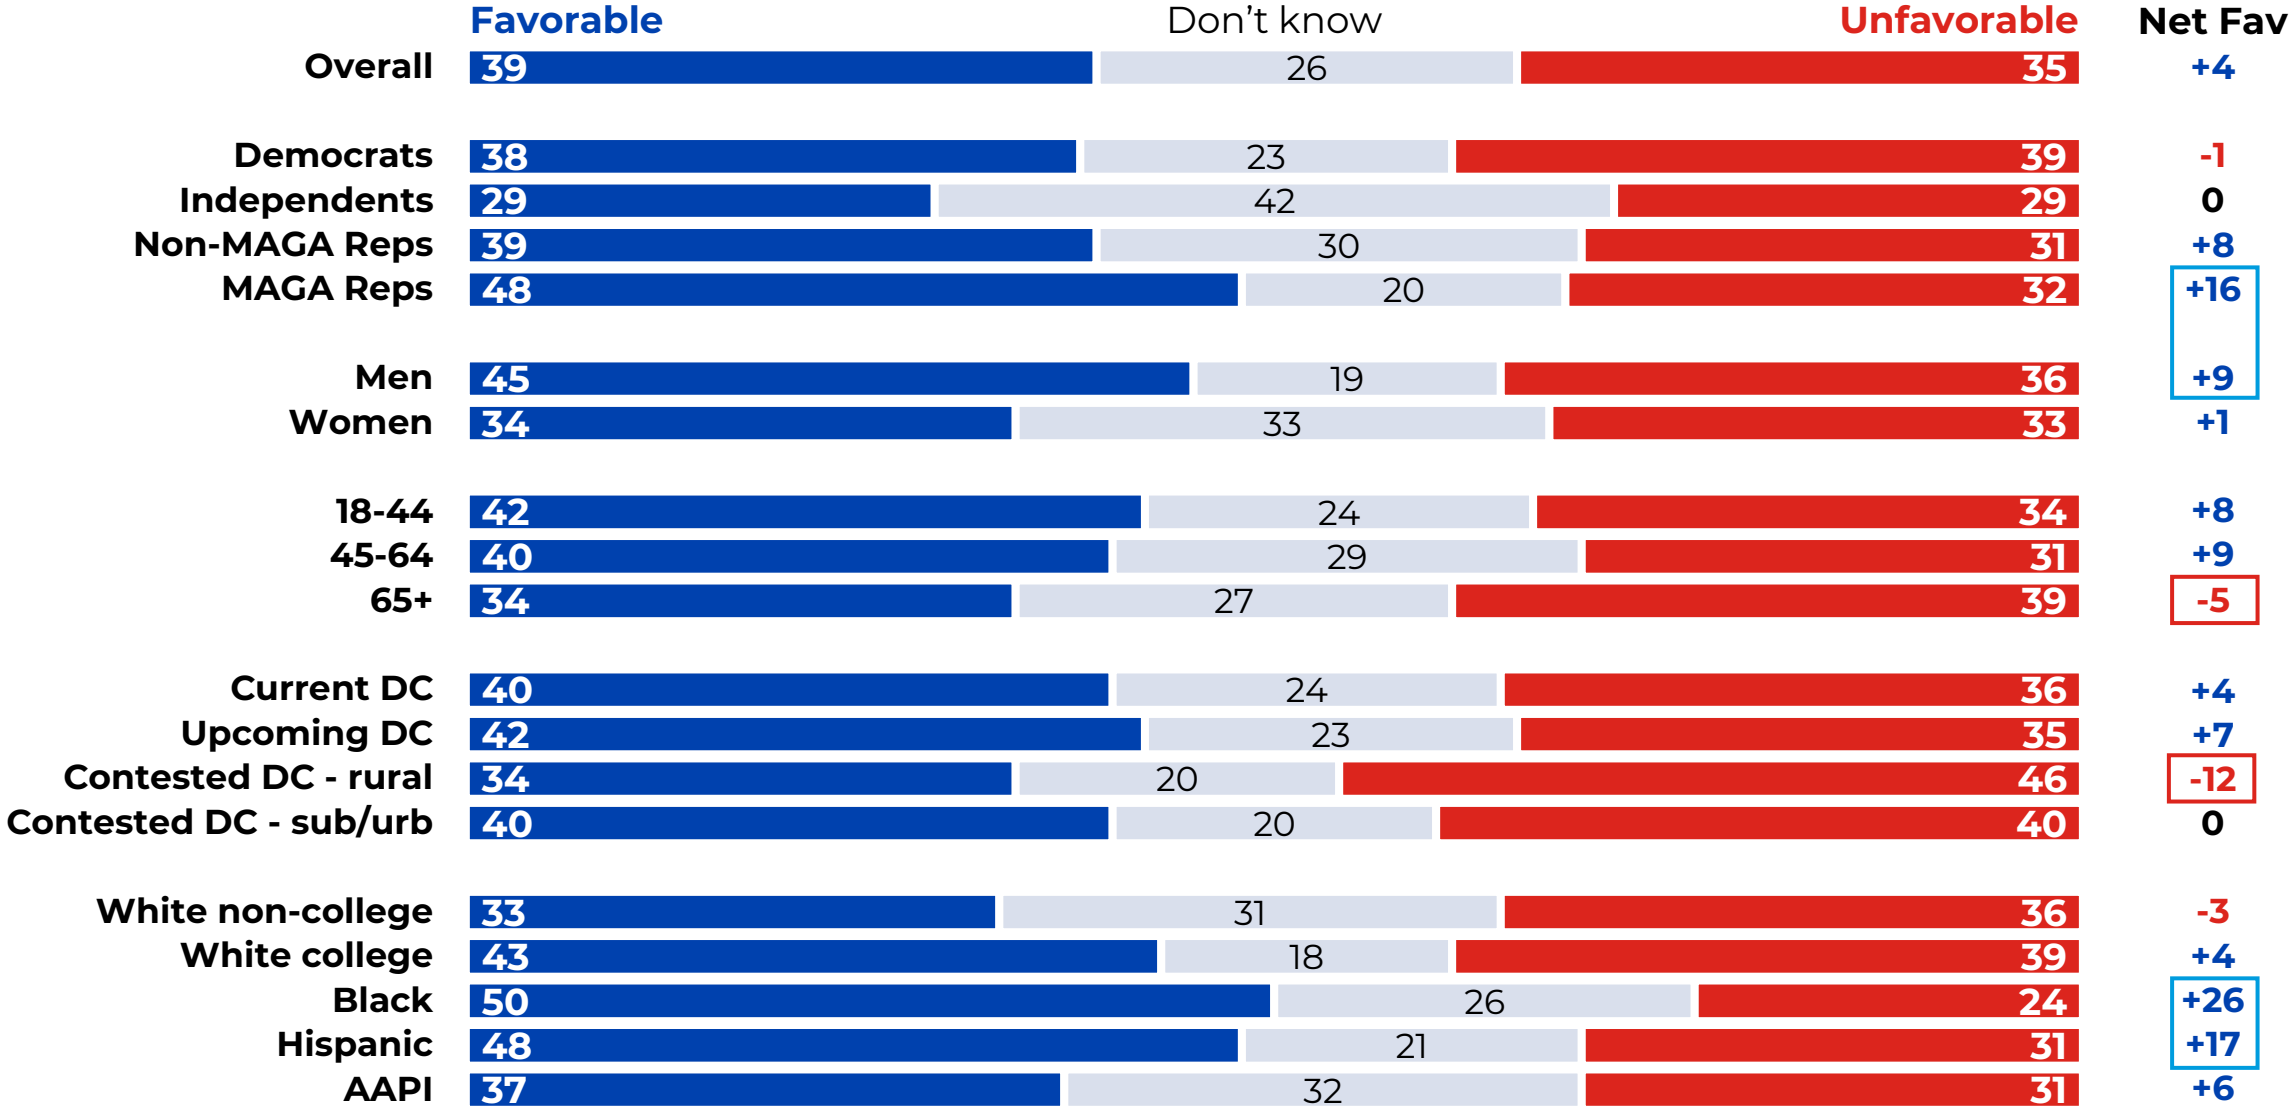

Please indicate who you personally trust more to handle each issue.

Data Center Landscape

Men, younger voters, Black voters, Hispanic voters, MAGA most amenable to data centers. Seniors, those in rural counties with contested data centers negative

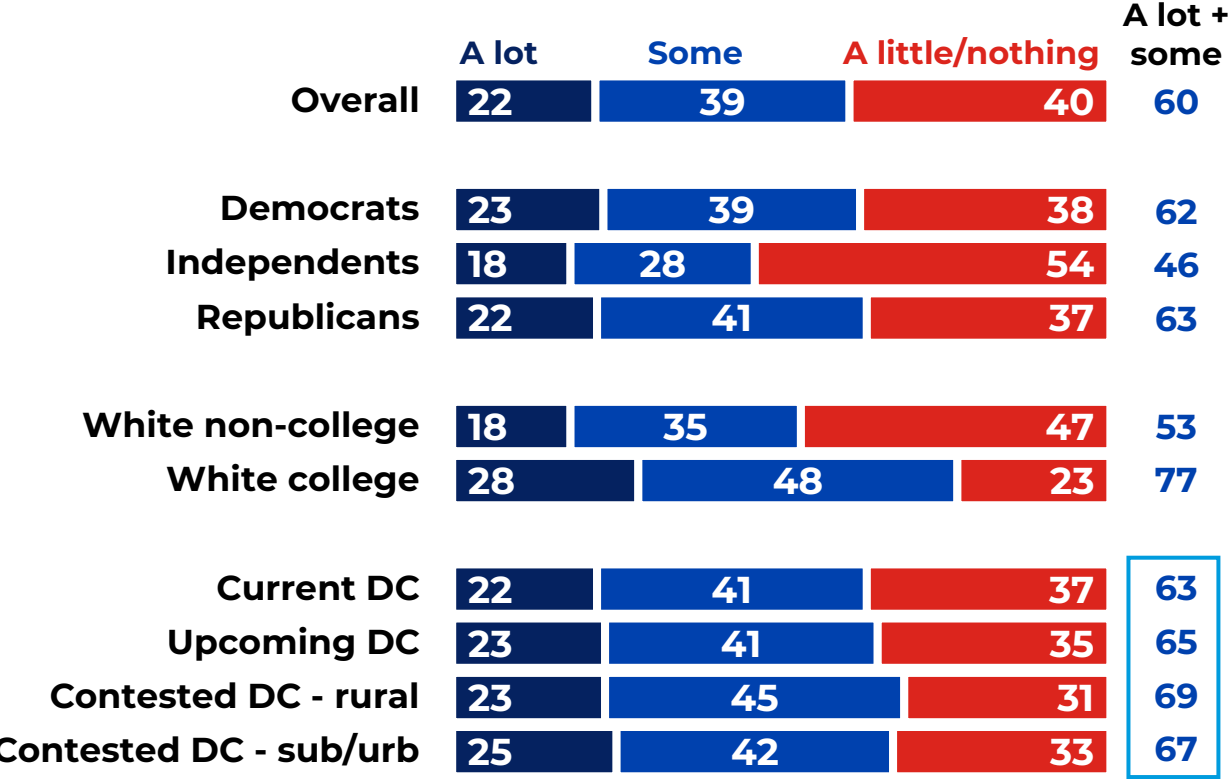

Favorability of Data Centers

Most aren't hearing "a lot" on data centers. Those with new data centers emerging/being debated in their counties hearing somewhat more

How much have you seen, read, or heard about data centers being built or considered in the U.S.?

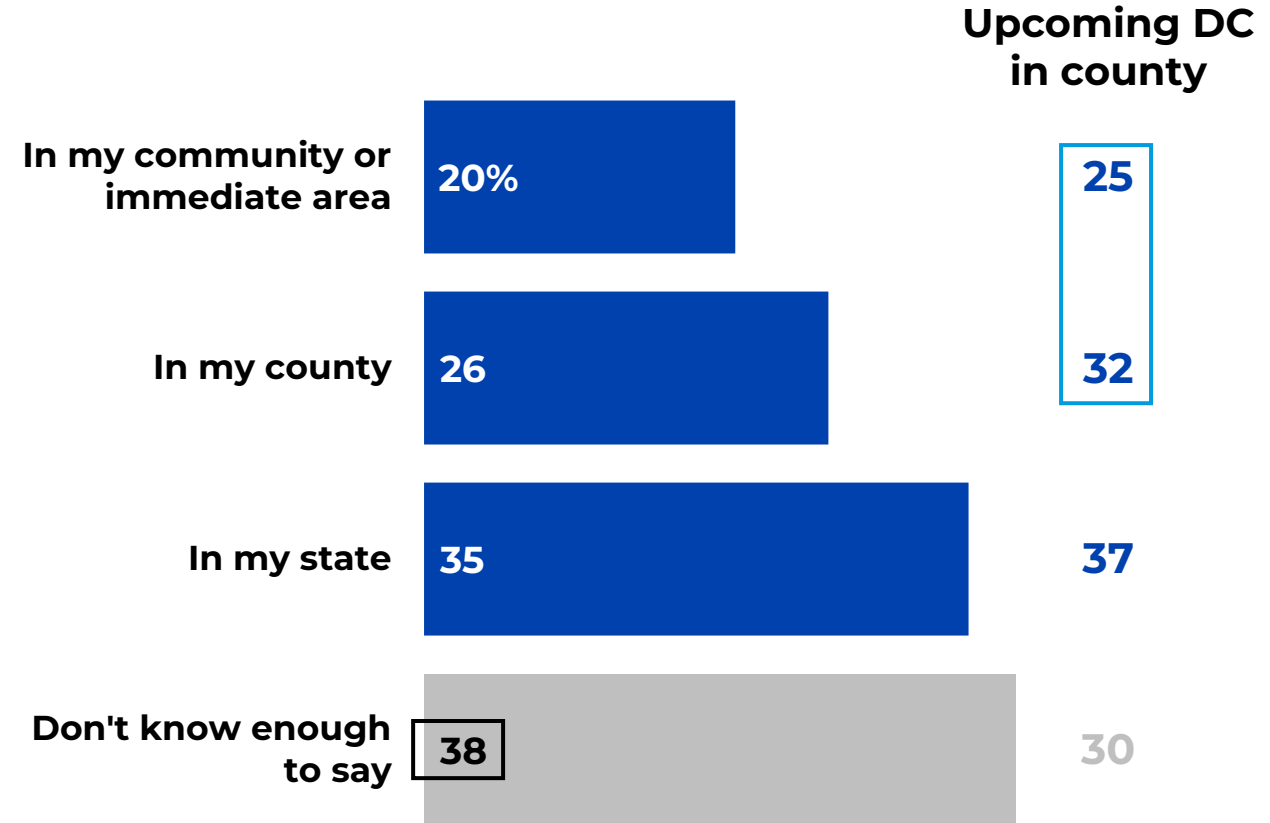

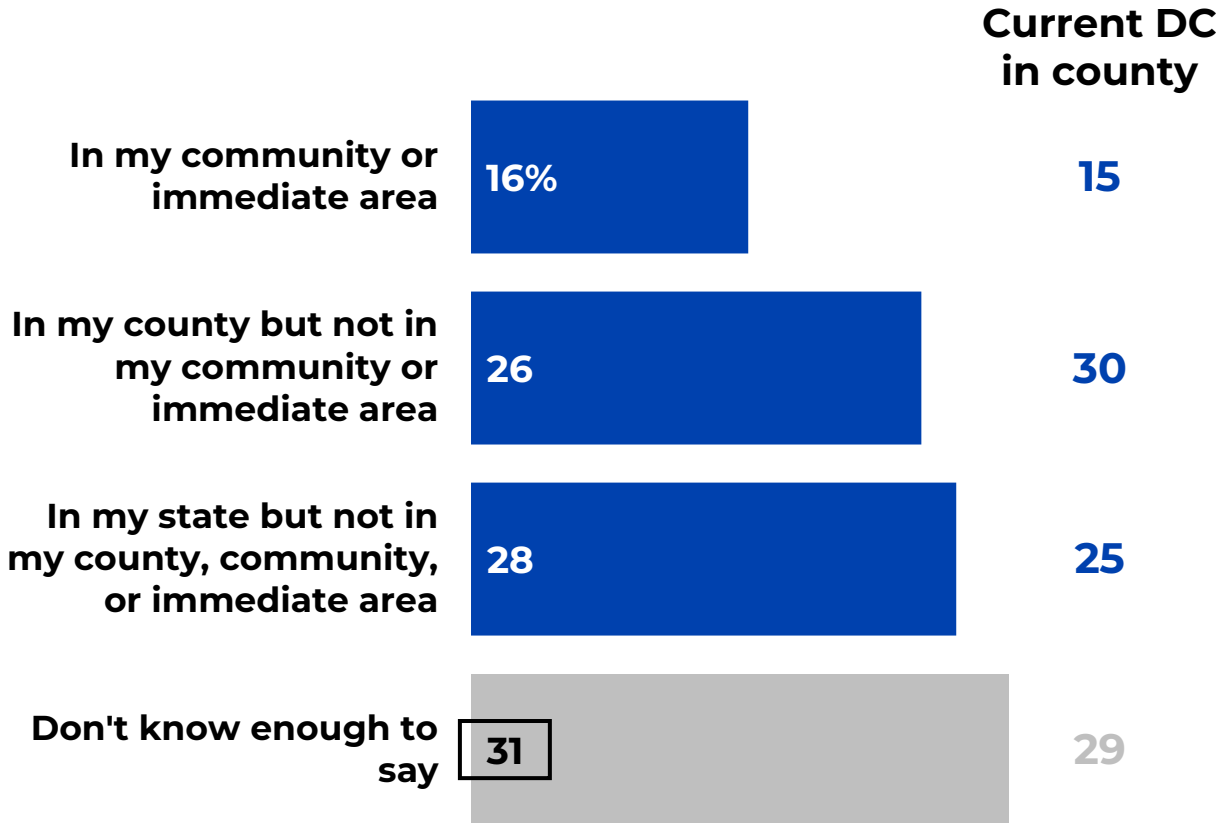

How much have you seen, read, or heard about data centers being built or considered in your community?

Pluralities don't know enough about data centers to say where they are/where they are coming. Those in counties with upcoming data centers somewhat more aware they are planned

Where do you think the **closest** data center is to you?

Where are data centers being planned or considered near you, if anywhere? [Select all that apply]

“Data center uninformed” voters skew more female, independent, non-college, passive news consumers disengaged from politics. They feel their utility costs rising but do not trust either party yet on these issues

Voters who are data center uninformed – who have not heard about data centers locally or nationally, and do not know where the nearest data center is to them – make up 21% of voters.

Overall electorate 100%	DC uninformed 21%	Total	Overall electorate 100%	DC uninformed 21%	Total	Overall electorate 100%	DC uninformed 21%	Total
45	42	Democrats	41	35	18-44	31	15	Politics is v. impt to identity
13	20	Independents	31	36	45-64	35	28	Somewhat important
43	38	Republicans	28	29	65+	35	56	Not that impt/Not impt
47	32	Men	67	79	Non-college	60	45	I seek out news
53	68	Women	33	21	College	40	55	News comes to me
			28	18	Liberal			
			38	49	Moderate			
			34	33	Conservative			

Attitudinally, they are cost-pressured on utilities – but don’t trust either party to handle data centers.

82% say their utility costs are rising

66% say they don’t trust either party on data centers or are not sure

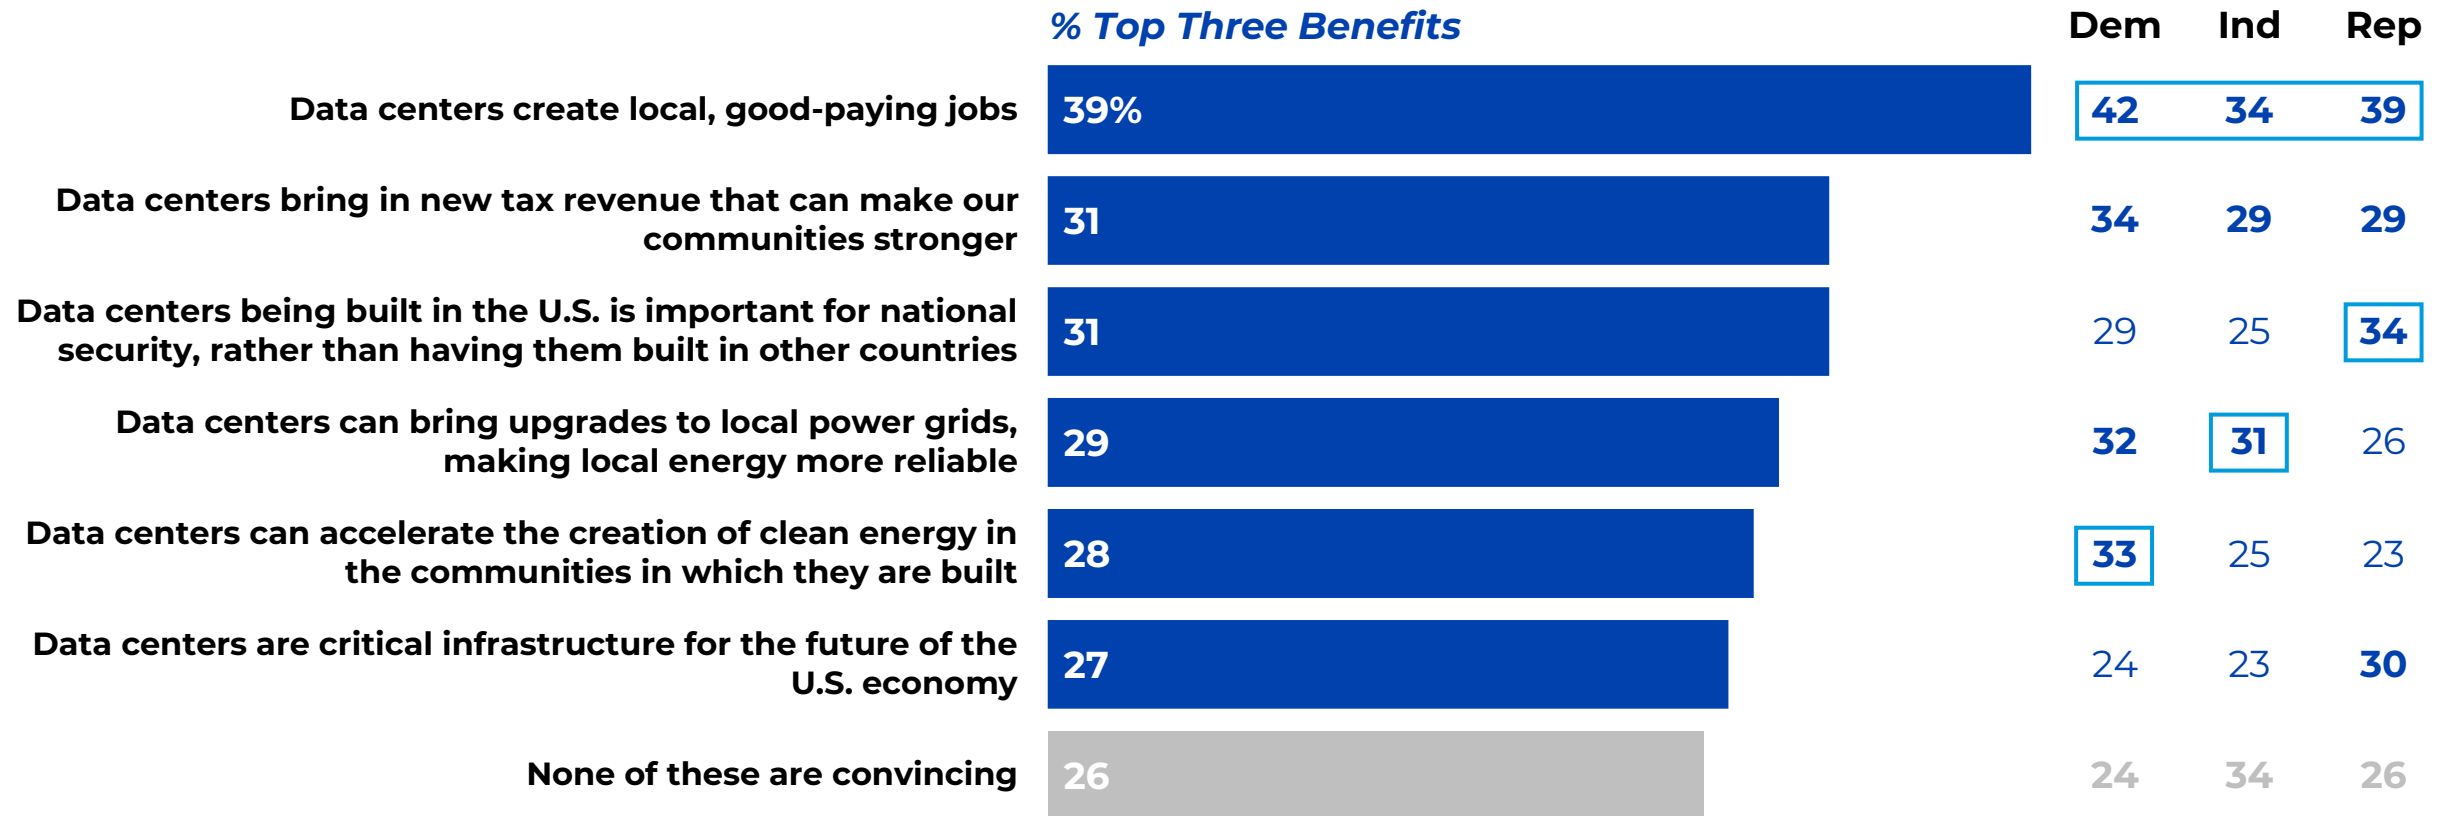

Data center NIMBYs: while voters are divided on both measures, there is more support for data centers nationally than in voters' backyards

Do you support or oppose data centers being built...

Job creation is the best reason for many to support local data centers. Independents like grid upgrades and new tax revenue, and Democrats like data centers as a way to accelerate the clean energy transition

Most convincing reasons to support data center in community

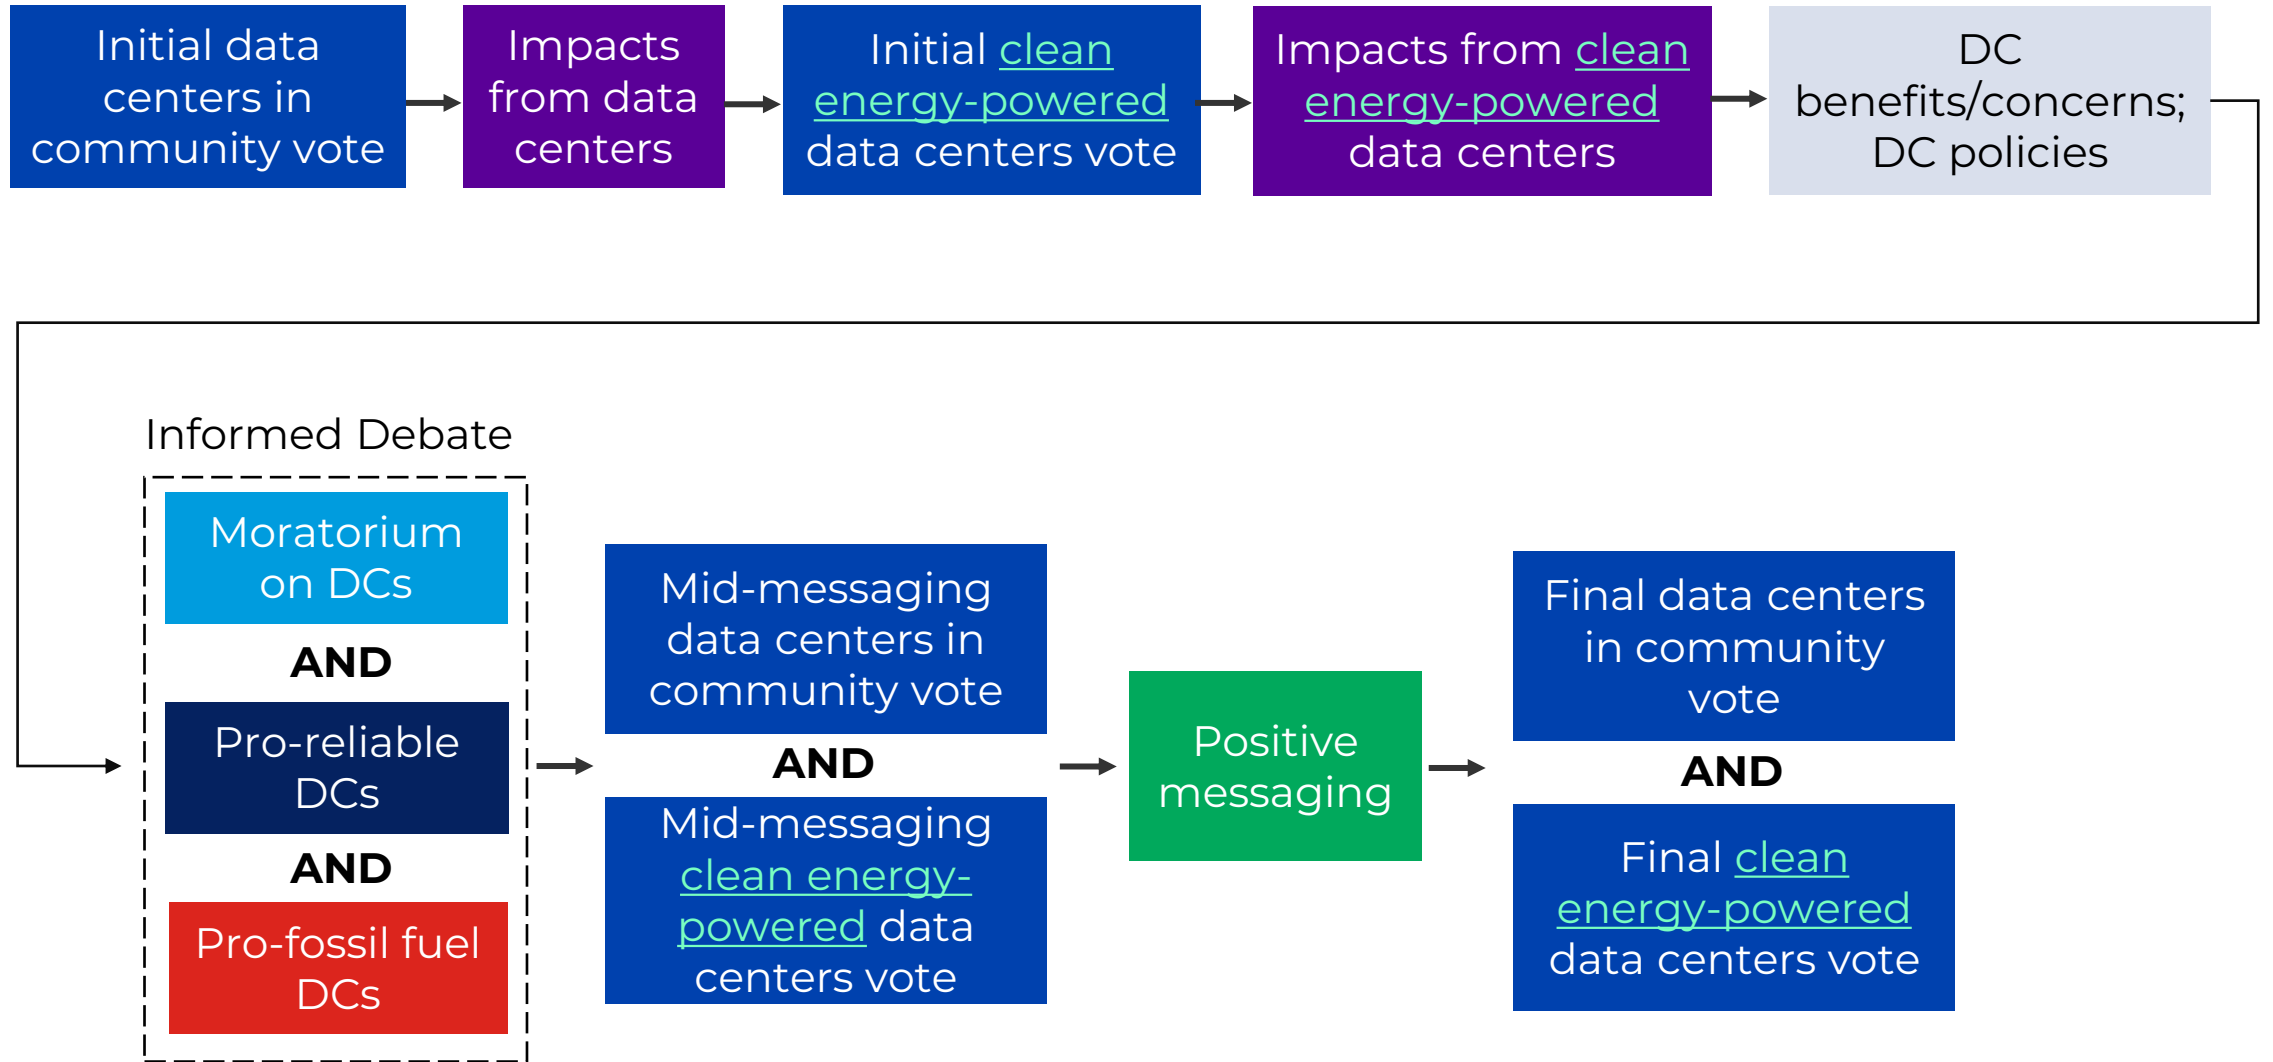

The greatest concern on data centers is the impact on utility costs, followed by water and electricity strains and favored rates/subsidies for DCs

Most concerning aspects of having a data center in community

Clean Energy in the Data Center Debate

Survey structure

Powering data centers with clean energy creates odd bedfellows: hyper-pro DC base is much more GOP, young, male. Clean energy base – who don't love data centers, but are brought in by clean energy – skew Dem, liberal, female

Vote Targets on Support for **Clean Energy-Powered** Data Center Built in Community

^{^/^^} designates split item

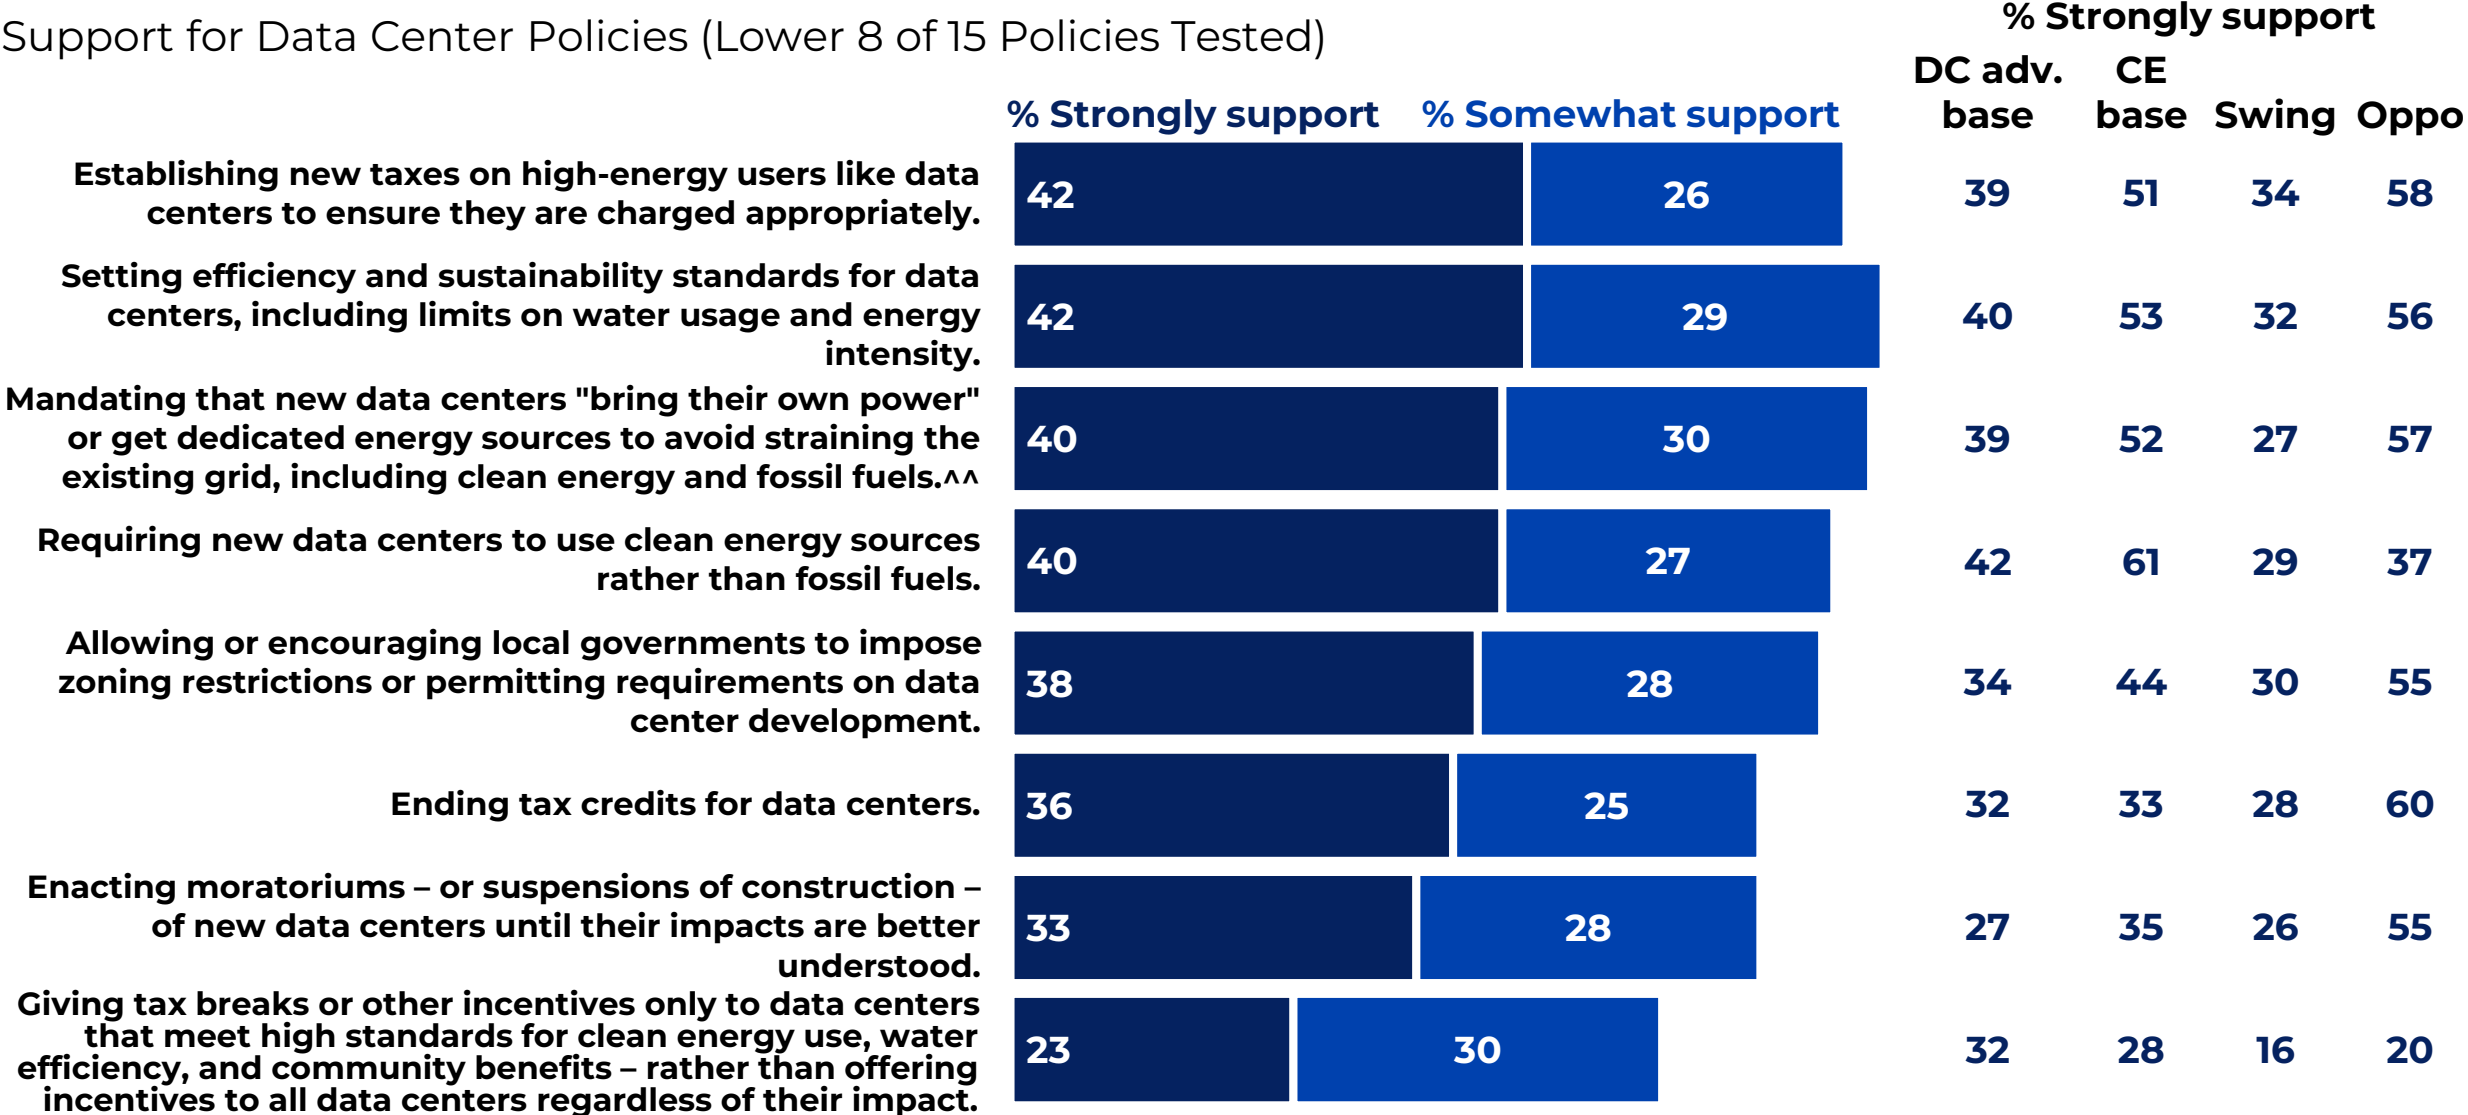

After learning a bit more about data centers, policies that put DCs in check not only garner support from clean energy base and swing, but oppo too

Support for Data Center Policies (Top 7 of 15 Policies Tested)

Policies that are less connected to energy bills and community impacts garner less intense support, though are still popular

Support for Data Center Policies (Lower 8 of 15 Policies Tested)

^{^^} designates split item

Movement and Messaging

In the argument for clean data centers, focusing on how clean energy is cheaper and will lower costs as well as provide reliable grid infrastructure is key

Highlighter Exercise – Pro-Clean Energy-Powered DCs

Data centers and AI are growing rapidly and will shape our future economy, presenting a major opportunity to drive local investments, strengthen national security, and accelerate the transition to **cheaper clean energy** like wind and solar. We can be pro-data center and pro-accountability. By having data center operators invest in new clean energy, grid upgrades and enhancements, and community energy like rooftop solar and battery storage in your neighborhood, these data centers can actually **help lower bills** for everyone in the community, while developing the energy abundance we need. By powering new data centers with clean energy, and making them part of the future of our community, we can ensure data centers support **long-term, reliable, resilient grid infrastructure** and bring broad, sustainable benefits for communities and the country - while helping **bring energy costs down.**

How convincing do you find this statement?

The strongest pieces of a moratorium argument highlight voters' concerns about DCs: local resource strain, higher costs, pollution. Even data center base voters see resonance in this

Highlighter Exercise – Moratorium on DCs

Data center development is **happening too quickly** and at the expense of local communities: their unchecked, rapid growth is **straining local power grids, driving up energy costs** for consumers, and **polluting** our air and water. Without stronger safeguards in place, communities risk bearing the **environmental** and financial burdens without seeing local benefits. Putting a **moratorium**, or pause, on new development would give policymakers time to **establish clear guidelines, protect public health**, do the research, and ensure infrastructure can handle demand so that all data center development is done **without raising consumers' utility bills** or harming the environment.

How convincing do you find this statement?

Data center advocate base voters are deeply drawn to a gas-powered DC argument; it doesn't work with CE base or clean DC swing

Highlighter Exercise – Pro-Fossil Fuel-Powered DCs

AI and data centers are **critical to America's economic future** and **national security**, driving innovation, productivity, and global competitiveness, and ensuring the U.S. does not fall behind China or India. Their rapid expansion should be embraced, not restricted. Imposing strict green energy mandates to use wind and solar risks slowing growth, raising costs, and limiting the ability to scale quickly to meet demand.

Natural gas remains the most affordable, reliable, and abundant energy source in the U.S., making it essential for powering this infrastructure efficiently. Rather than overregulating, policymakers should prioritize speed, flexibility, and energy abundance to ensure the U.S. leads in AI development while keeping costs low and maintaining energy reliability.

How convincing do you find this statement?

A range of arguments in favor of clean DCs are compelling. For CE base and swing, responsible DCs, increasing grid reliability, local benefits, and vehicles for clean energy are compelling; for swing also, nat'l security appeals

[RESPONSIBLE] Data centers are essential to our economy and future, but **we need a balanced approach that is fair to local communities so they get a say in when and how they are built.** And companies should be held to their commitments – on jobs, infrastructure, and environmental impact – and responsible for any harm they cause. **We can support innovation and data centers, powered by clean energy, while ensuring local communities aren't left bearing the costs.**

[RELIABILITY] Building data centers with clean energy isn't just about keeping costs down or protecting the environment: it's about increasing the reliability of our grid. Right now, our power grid is incredibly outdated, with much of the technology being decades, if not centuries, old. Investing in clean energy to power data centers can make our systems more resilient, more cost-effective, more efficient, and less dependent on volatile fossil fuels, protecting consumers.

[LOCAL BENEFIT] Data centers can be powerful in generating local economic growth – if they are done in the right way. **That means creating good-paying local jobs, investing in local communities including their electricity grid, and bringing new clean energy online.** These investments can help bring down energy costs for all of us long-term, by bringing more clean power online and increasing cheaper, more abundant energy.

[CLEAN ENERGY BEST] Data centers are coming – fast – and the question isn't if, but how we power them. **Clean energy is already the fastest and cheapest way to meet rising energy demand at scale.** It delivers reliable power, lowers long-term costs, and avoids delays tied to fuel constraints, making it the smartest path to support data center growth while bringing down energy bills long-term by developing more of these clean energy sources.

[FUTURE] AI and data centers will shape the future economy, whether we like it or not. **By prioritizing clean energy, innovation, and smart planning today, we can make sure that this future is sustainable and inclusive of local communities.** That means an embrace of responsible development that generates local investment, creates jobs, and allows communities to lead in the industries of the future, without compromising the local environment or economy.

[NATIONAL SECURITY] AI and data centers are going to continue to expand, whether that is on U.S. soil or elsewhere. **By leaning in and developing clean energy-powered, local data centers, we can increase our national security at a volatile time, keeping our data protected here at home.** Not to mention, the continued development of clean energy reduces our reliance on other countries for fossil fuels.

[CLEAN ENERGY OPP] The rapid growth of data centers is a huge opportunity to accelerate America's transition to clean energy. Realistically, these data centers are going to get built in the U.S. either way – by powering these facilities with clean energy, we can take advantage of this new investment to benefit all Americans. Done right, data centers don't just consume energy: they can drive investment in a cleaner, more reliable power grid.

Highlighting how utility bills are still rising, sweetheart deals for tech while selling out Americans, and utility greed are all strong against Trump/GOP

Concerning Claims About Data Centers

Ovr. Dem Ind Rep

% concerning (4 or 5 out of 5)

58	69	51	49	<p>[LIES] Trump said data centers won't raise your electricity bills – but it's still happening right now. Across the country, utility companies are raising rates because of data center demand. In Pennsylvania, regulators just approved a nearly \$300 million rate increase tied in part to the state becoming a data center hub, just two weeks after Trump said data centers won't raise bills. That cost is going to get passed onto consumers, who are already paying far more in utility costs this year than they were last year.</p>
58	69	54	47	<p>[UTILITIES] Monopoly utility companies are increasing electricity rates more than twice as fast as the rate of inflation, making massive profits, and paying out millions in bonuses to their executives by overcharging American families, who have no choice about where they get their electricity. Yet, Trump and Republicans have done very little or nothing to increase accountability for monopoly utility companies, including when it comes to building infrastructure for data centers, as they contribute millions of dollars to their campaigns.</p>
57	71	53	43	<p>[TECH] Right now, Trump and Republicans want to give data centers and the tech billionaires who are behind them sweetheart, backroom deals, with voluntary, so-called "pledges" to protect consumers' costs – but no guarantee that that will happen. Instead, they're giving massive tax breaks and subsidies to AI companies to build data centers, with effectively no regulations to protect the local communities where they are being built. They're selling Americans out to make a profit.</p>
55	71	50	40	<p>[BAN] Right now, as data centers continue to expand and the need for more energy grows, Trump and Republicans are banning most clean energy projects, including terminating projects that were 80% complete, all to force a reliance on fossil fuels. Now is not the time to ban any source of energy, especially with our growing needs: clean energy is a key part of supporting the growing demands for electricity caused by data centers, to keep consumers' costs down.</p>
54	69	52	38	<p>[OIL AND GAS] During his 2024 campaign, Trump promised big oil CEOs a "deal" if they donated millions to his campaign. They came through for him, so now Donald Trump is making good on his promise by eliminating wind and solar projects, including terminating projects that were 80% complete, all to force reliance on fossil fuels. He wants to make sure data centers are primarily powered by fossil fuels, instead of building the clean energy resources that could help power this transition responsibly.</p>

Conclusions and Recommendations

Conclusions and Recommendations

Voters do not trust data centers and the AI/tech companies behind them to look out for them. Policies that allow data centers to exist while putting appropriate checks in place that speak to their concerns – environmental harms and costs going up – are extremely popular, even among those for whom powering data centers with clean energy is still not quite enough to get their support.

As a result, a pro-accountability approach is much stronger than a pro-innovation framework. In an environment where there is little trust in corporations to look out for voters, elected officials need to make it clear they don't put AI/tech companies first. In addition to centering cost of living, for tenuous clean energy base voters and swing, we should focus on how this approach prioritizes:

- Keeping utility bills down for working families
- Accountability for data centers and their backers
- Responsible development that keeps in mind community needs, particularly not over-straining electricity and water
- An increase in grid reliability with much-needed updates
- (For clean energy base) A vehicle through which to move the clean energy power transition forward
- (For swing) An increase in national security

And in going negative on Trump and Republicans on data centers and utilities, there are signs that going after them for sweetheart tech company deals and collaborating with greedy utility companies – all to make a profit at voters' expense – are particularly persuasive among swing.

The Pitch for Governors and Mayors

Setting the stage: Right now, we all know one thing for certain: energy bills are rising, and families are struggling.

We're seeing more demand on our energy system than ever, including from data centers. And while these projects can bring jobs and local economic growth, we need to hold them accountable.

Clean energy DC argument: We need to make sure data centers don't drive up local utility bills, put too much strain on our local energy grids or water supply, or release harmful pollution into our communities. And the best way to do that is by powering them with clean energy like wind and solar – not fossil fuels, like coal or diesel generators next to data centers.

When they are powered with cheap, clean energy, they can actually help bring down community energy costs by bringing more wind and solar power online, which also helps ensure our grid is reliable over the long term.

Additional policy prescriptions: This means instituting strong local protections from air, water, and noise pollution from data centers, and requiring data centers to:

- Fund transmission and grid upgrades
- Reduce their energy use during periods of high demand to increase reliability
- Demonstrate clear economic benefits, including high-quality, long-term job creation

Implications for voters: If a company wants to build their data center here, they need to do so responsibly, using clean energy and developing the resources they need, protecting our grid, and delivering real, lasting benefits for our communities.

Because we're not going to accept higher utility bills, strains on our energy and water, or more pollution. We're going to have data centers that work for the communities they're lucky enough to build in.

GSG FOR CLIMATE POWER, APRIL 2026

Appendix

There appears to be little daylight between “renewable” vs. “clean” energy, especially with Democrats and independents

Renewable Energy Favorability

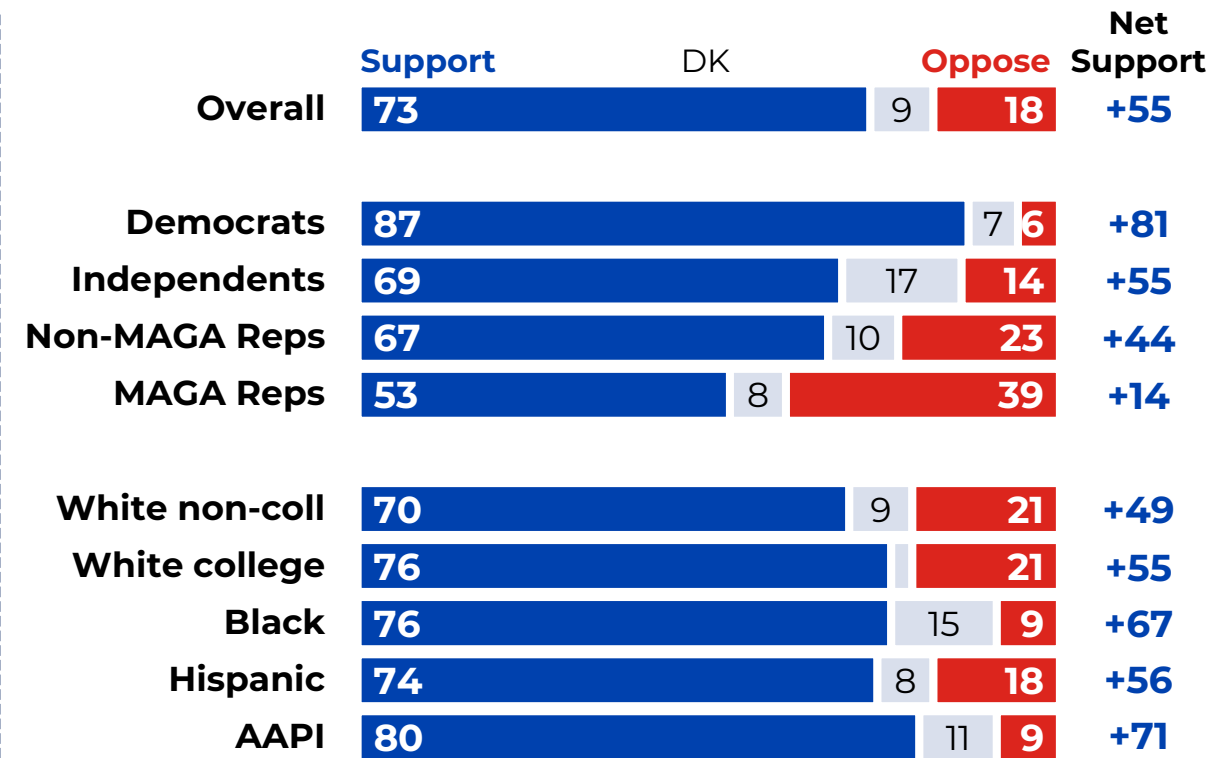

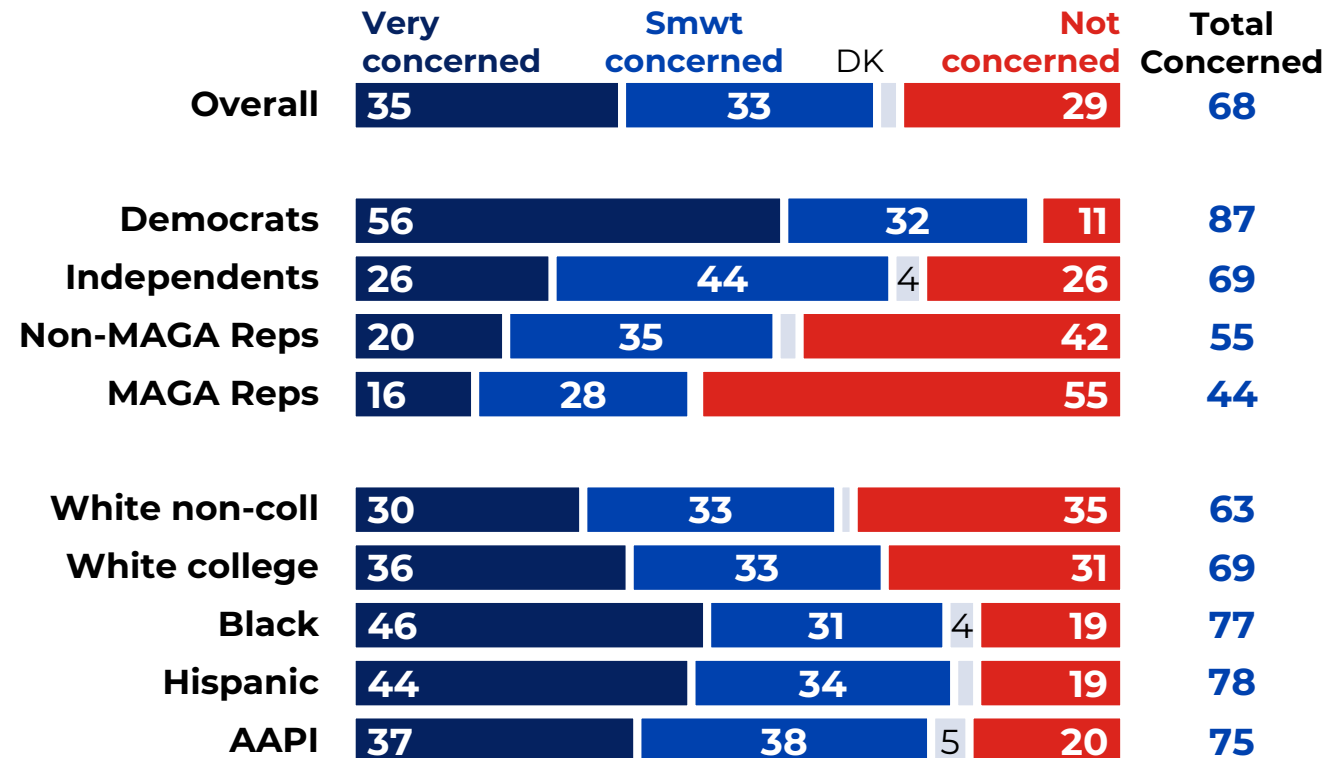

Clean Energy Favorability

Voters – even a decent share of MAGA Republicans – are concerned about climate change and want to see local leaders take action

How concerned are you about climate change?

Do you support or oppose local and state leaders taking action to reduce pollution and address climate change?

Messaging in favor of clean energy-powered data centers inadvertently increases support for data centers overall (though it still falls short of clean energy-powered DCs)

Do you support or oppose data centers being built in your community?

	Initial Vote				Mid-Messaging Vote				Final Vote				Change

Only the most ardent of DC supporters believe the actors behind them are acting in Americans' interests; others are skeptical of tech companies

Which statement do you agree with more?

Data centers are ultimately run by big AI companies and billionaire CEOs who will say whatever they need to get local approval – but the second profits are on the line, they'll put their bottom line ahead of the communities they operate in. We need more regulations to make sure communities stay protected no matter what.

Data centers are built under contracts with binding agreements, abiding by state and local regulations and public oversight – not just vague promises. Companies have to comply with permits, environmental rules, and community standards. **These companies want to do right by the community so that everyone can benefit and create a lasting partnership that works for everyone.**

Again, a range of arguments are compelling; for clean energy base/DC uninformed, it's reliability, economic growth, responsible development, and for clean energy base, using DCs to transition to clean. It's all of the above for swing

Most convincing reasons to support local clean energy-powered data centers
